Chemistry How Sublime Laying The

Sublimation is the transition from the solid phase to the gas phase without passing through an intermediate liquid phase. This endothermic phase transition occurs at temperatures and pressures below the triple point. The term only applies to physical changes of state and not to the transformation of a solid into a gas during a chemical reaction.

Sublimation Definition (Phase Transition in Chemistry)

So, all solids that possess an appreciable vapour pressure at a certain temperature usually can sublime in air (e.g. water ice just below 0 ° C). For some substances, such as carbon and arsenic , sublimation is much easier than evaporation from the melt, because the pressure of their triple point is very high, and it is difficult to obtain them as liquids.
