An Introduction to the Theory of Functional Equations and ...

Functional equations are equations where the unknowns are functions, rather than a traditional variable. However, the methods used to solve functional equations can be quite different than the methods for isolating a traditional variable. Each functional equation provides some information about a function or about multiple functions.

One major change was a complete new presentation of linear systems (Chapters 6~9) for retarded and neutral functional differential equations. The theory of dissipative systems (Chapter 4) and global attractors was completely revamped as well as the invariant manifold theory (Chapter 10) near equilibrium points and periodic orbits.

Example 3.3 (Jensen's Functional Equation) Solve over  $\mathbb{Q}$ :  $f(x) + f(y) = 2f\left(\frac{x+y}{2}\right)$ . Solution. This time, our preliminary checks reveal that  $f(x) = kx + c$  works for any  $k$  and  $c$ . (In a vague sense, the fact that  $c$  is free to vary is manifested in the fact that

Functional differential equations of neutral type, or neutral differential equations occur when  $\max \{ n_1, n_2, \dots, n_k \} = n$ .  $\{\displaystyle \max\{n_{\{1\}},n_{\{2\}},\ldots,n_{\{k\}}\}=n.\}$  Neutral differential equations depend on past and present values of the function, similarly to retarded differential equations, except it also depends on derivatives with delays.
