Mathematical and Computer Modelling

Computer simulation is the process of mathematical modelling, performed on a computer, which is designed to predict the behaviour of or the outcome of a real-world or physical system. Since t the reliability of chosen mathematical models, computer simulations have become a useful tool for the mathematical modeling of many natural systems in physics, astrophysics, climatology, chem manufacturing, as well as human systems in economics, psychology, social science

I found this book very helpful for becoming familiar with mathematical models of physiological systems, especially cardiovascular and pulmonary dynamics. The best way to understand systems, e physiological system dynamics, is through creating math models and then simulating these models in real time and or non real time.
