In this volume the underlying logic and practice of maximum likelihood (ML) estimation is made clear by providing a general modeling framework that utilizes the tools of ML methods.

Maximum Likelihood Estimation: Logic and Practice by Scott ...

In statistics, maximum likelihood estimation is a method of estimating the parameters of a probability distribution by maximizing a likelihood function, so that under the assumed statistical model the observed data is most probable. The point in the parameter space that maximizes the likelihood function is called the maximum likelihood estimate. The logic of maximum likelihood is both intuitive and flexible, and as such the method has become a dominant means of statistical inference. If the like

Maximum likelihood estimation (MLE) is a technique used for estimating the parameters of a given distribution, using some observed data.

Maximum Likelihood Estimation (MLE) | Brilliant Math ...
Maximum likelihood estimation is a method that determines values for the parameters of a model. The parameter values are found such that they maximise the likelihood that the process described by the model produced the data that were actually observed.

Probability concepts explained: Maximum likelihood estimation

It seems reasonable that a good estimate of the unknown parameter θ would be the value of θ that maximizes the probability, errrr... that is, the likelihood... of getting the data we observed. (So, do you see from where the name "maximum likelihood" comes?) So, that is, in a nutshell, the idea behind the method of maximum likelihood estimation.

The Maximum Likelihood Estimation (MLE) is a method of estimating the parameters of a model. This estimation method is one of the most widely used. The method of maximum likelihood selects the set of values of the model parameters that maximizes the likelihood function. Intuitively, this maximizes the "agreement" of the selected model with the

StatQuest: Maximum Likelihood, clearly explained!!!

Maximum Likelihood Estimation (MLE) is a tool we use in machine learning to achieve a very common goal. The goal is to create a statistical model, which is able to perform some task on yet unseen data. The task might be classification, regression, or something else, so the nature of the task does not define MLE.
