The Ecological Hoofprint The Global

The Ecological Hoofprint: The Global Burden of Industrial Livestock By Tony Weis The Ecological Hoofprint examines the industrialization of livestock production on a world scale, which is the driving force behind the phenomenal and uneven increase in global meat consumption, and the momentous but greatly underappreciated implications of this trajectory.

The Ecological Hoofprint - The Global Burden of Industrial ...

In The Ecological Hoofprint Weis puts meat at the centre of global problems like climate change, poverty, workers' rights, and speciesism. Anyone seeking a just and sustainable world needs to consider his compelling argument that radical change must start by combating the meatification of the human diet.'

The Ecological Hoofprint: The Global Burden of Industrial ...

When we think about the ecological effects of livestock agriculture, many of us reflexively think about soil erosion, water pollution, or cutting down the rainforests. Tony Weis, in The Ecological Hoofprint, shows that there is much more going on. There is an entire social framework underpinning livestock agriculture.

In The Ecological Hoofprint Weis puts meat at the centre of global problems like climate change, poverty, workers' rights, and speciesism. Anyone seeking a just and sustainable world needs to consider his compelling argument that radical change must start by combating the meatification of the human diet.'

The Ecological Hoofprint: The Global Burden of Industrial ...

The ecological footprint measures human demand on nature, i.e., the quantity of nature it takes to support people or an economy. It tracks this demand through an ecological accounting system. The accounts contrast the biologically productive area people use for their consumption to the biologically productive area available within a region or the world. In short, it is a measure of human impact on Earth's ecosystem and reveals the dependence of the human economy on natural capital. Footprint and

Ecological footprint - Wikipedia

The Ecological Footprint tracks the use of six categories of productive surface areas: cropland, grazing land, fishing grounds, built-up land, forest area, and carbon demand on land. On the supply side, a city, state or nation 's biocapacity represents the productivity of its ecological assets (including cropland,...
